

Week 1 Team Agreement and App Brainstorm

Team Member Names

- Kishore Prasanth Rajasekaran
- Sivmeng Oeng
- Krishnamoorthy Ramanath
- Xin Rao

Five Guidelines for Holding Team Members Accountable

1. **Clear Task Allocation:** We will assign work during our weekly meetings, which could get everyone to know exactly what they are responsible for, and all tasks will have clear expectations and deadlines.
2. **Weekly Check-ins:** We will have our weekly meetings for us to meet together and communicate the progress of the project. It's a great chance for everyone to provide an update for the work and identify any bottleneck for the whole project and align everyone's understanding of the whole project, which can move the project forward smoothly.
3. **Transparent Communication:** We are keeping everyone in a loop, which helps that all the communications are clear and understood. If anything comes up and the team cannot meet the deadlines, just give the team a head up, so teams are not left waiting for something without knowing why.
4. **Peer Review System:** Before anything gets finalised, such as code and design, at least one of the team members needs to go over it. This method is not about punishment; it is about catching things early and making sure we all have great products before shipping them to the customers.
5. **Missed Deadline Policy:** If someone keeps missing the deadlines without a heads-up or a legitimate reason, we will have an honest team conversation about it, and we will provide as much support to help the team as much as we can. If the situation doesn't change for the better, we have to change the position and responsibilities of our team member. We just want to bring the project right back to check and keep everyone treated fairly.

App Name: InnerCircle

App Description:

What we are going to develop is a social media web application which is dedicated for employees. The main purpose of this application is to improve cooperation between different teams, raise morale, and build the sense of community in the company. In order to achieve this ambitious goal, we are planning to keep a light architecture and optimise for both portable

platforms and laptops and finally build a fluent and highly responsive web platform. Furthermore, we also plan to design all dedicated brands, logos and other vision elements which are suitable for startup companies. Our main requirements include:

- **A signup process:** New employees can register for the application using a secure internal platform.
- **A login form:** Registered users can login to the application which allows authenticated access.
- **A logout facility:** Lets users securely end their active sessions and logout from the application.
- **Session control:** The app will track the user's logged-in state across all pages so they don't have to keep signing in. This will be handled through secure session tokens.
- **User profiles with uploaded thumbnails:** Employees will be able to create personalized profiles featuring an uploaded profile picture.
- **A member directory:** A list of all registered employees for finding and identifying colleagues across departments
- **Adding members as friends:** Employees can stay connected with and follow their colleagues.
- **Public and private messaging between members:** Messaging will include both 1:1 chats and group conversations between users.
- **Styling the project:** CSS Styling to make it look professional and minimalistic.
